PTM: In periplasm, it forms a disulfide bond, which prevents the oligomerization. In outer membrane vesicles, the redox status prevents formation of the disulfide bond, leading to oligomerization and pore formation (By similarity).

SIMILARITY: Belongs to the hemolysin E family.
                                                                                                                                                                                                                                                                                                                                                          similarity).

Bacteriol. 185:2330-2337(2003).

-i. FUNCTION: Toxin, which has some hemolytic activity towards mammalian cells. Acts by forming a pore-like structure upon contact with mammalian cells (By similarity).

-i. SUBDUT: Monomer and oligomer. In periplasm, it is present as a monomer, while in outer membrane vesicles, it oligomerizes to form a pore structure that is active. Probably forms an octamer (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SEQUENCE FROM N.A.

PTM: In periplasm, it forms a disulfide bond, which prevents the oligomerization. In outer membrane vesicles, the redox status prevents formation of the disulfide bond, leading to oligomerization and pore formation (By similarity).
SUBCELLULÂR LOCATION: Secreted. Exported from the cell by outer membrane vesicles. Also found in the periplasmic space (By

C-11 100:265-276(2000).

C-12 FUNCTION: Toxin, which has some hemolytic activity towards mammalian cells. Acts by forming a pore-like structure upon context with mammalian cells.

C-12 FUNCTION: Toxin and oligomer. In periplasm, it is present as a monomer, while in outer membrane vesicles, it oligomerizes to form a pore structure that is active. Probably forms an octamer.

C-12 FUNCTION: During anaerobic growth. Weakly or not expressed in most strains. It is activated by slyA, while it is slienced by H. NS. Its expression is also regulated by CRP and FNR.

C-12 FUNCTION: During anaerobic growth. Weakly or not expressed in most strains. It is activated by slyA, while it is slienced by H. NS. Its expression is also regulated by CRP and FNR.

C-12 FUNCTION: During anaerobic growth. Weakly or not expressed in most strains. It is activated by slyA, while it is slienced by H. NS. Its expression is also regulated by CRP and FNR.

C-13 FUNCTION: During anaerobic growth. Weakly or not expressed in most strains are oligomerization. In outer membrane vesicles, the redox status prevents formation of the disulfide vesicles, the redox membrane. Membrane vesicles. Membrane. Membrane. Membrane. Membrane. Membrane. Membrane. Membrane. I. DNA Res. 8:11-22[2001].

I. PUNCTION: Toxin, which has some hemolytic activity towards mammalian cells. Acts by forming a pore-like structure upon contact with mammalian cells (By similarity).

Contact with mammalian cells (By similarity).

Contact with mammalian cells (By similarity).

Contact with mammalian cells (By similarity).

A pore structure that is active. Probably forms an octamer (By alminatory).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This SWISS-PROT entry is copyright. In outer membrane vesicles, the redox status prevents formation of the disulfide bond, leading to oligomerization and pore formation (By similarity). SIMILARITY: Belongs to the hemolysin E family.
                                                                                                                                                                                                                                                                                                                                             STRAIN=C15:H7 (EDL933 / ATCC 700927 / EHEC;

"Extensive mosaic structure revealed by the complete genome sequence of uropathogenic Escherichia coll.";

To uropathogenic Escherichia coll.";

Proc. Natl. Acad. Sci. U.S.A.

C. -I - STMILARITY: Belongs to the hemolysin E family.

-I - SIMILARITY: Belongs to the hemolysin E family.

-I - SIMILARITY: Belongs to the hemolysin E family.

-I - SIMILARITY: Belongs to the hemolysin B family.

-I - SIMILARITY: Belongs to the hemolysin B family.

-I - SIMILARITY: Belongs to the probably not functional. May be a protein, and it is therefore probably not functional. May be a

"Sequence analysis of the genome of the unicellular cyanobacterium

Synechocystis sp. strain PCC6803. I. Sequence features in the 1 Mb

region from map positions 64% to 92% of the genome.";

PDNA Res. 2:153-166(1995).

-1 - CATALYTIC ACTIVITY: ATP + L-arginine + tRNA(Arg) = AMP +

diphosphate + L-arginyl-tRNA(Arg).

diphosphate + L-arginyl-tRNA(Arg).

-1 - SUBUNIT: Monomer (By similarity).

-1 - SUBCELLULAR LOCATION. Cytoplasmic.

-1 - SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                     Gaps
